The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The inprovement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED3 protein. The AtNCED3 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for example in plant breeding. Neoxanthin cleavage enzyme years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Lycopersicon esculentum neoxanthin cleavage enzyme, LeNCED1 protein related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A DNA encoding a protein with a neoxanthin cleavage activity for producing transgenic plants with improved or decreased stress tolerance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tomato; neoxanthin cleavage enzyme; LeNCED1; abscisic acid; ABA; stress tolerance; transgenic plant; plant breeding; antisense-therapy; plant growth protectant; herbicide.
                                                                                                                                                                                                                                                                                                                   Sequence

This invention relates to defence-related signalling genes isolated from the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage enzyme (NCE), an amino acid permease (AAP) and a glutamic acid rich protein (GRP). The signalling gene is useful for increasing the

The gene is useful for regulating gene expression in a plant, in response to a stimulus such as infection with a pathogen, damage from a pathogen, hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid, oxalic acid or expression of a gene encoding oxalic acid oxidase. The genes are also useful for stem-preferred regulation of gene expression in a plant. The genes are useful in agriculture, particularly in the present genes are useful for modifying amino acid transport and content in plants with improved agronomic traits, for modifying abscisic acid (ABA) metabolism and for modifying amino acid transport and content in plants. The present sequence represents a neoxanthin cleavage enzyme-like protein from Lycopersicon esculentum used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        characterisation of

Neoxanthin Cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Vigna unguiculata neoxanthin cleavage enzyme, CPRD65 (Cowbea Responsive to Dehydration) protein. CPRD65 gene is isolated from cowpea plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          stress tolerance; transgenic plant; plant breeding; antisense-therapy; plant growth protectant; CowPea Responsive to Dehvdration.

corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED1 protein. The AtNCED1 cDNA is obtained from an Arabidopsis plant-derived cDNA library using a cDNA of the CPRD65 (CowPea Responsive to Dehydration) gene isolated from cowpea plant as a probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid then removing the weed by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Zea mays neoxanthin cleavage enzyme, VP14 protein related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A DNA encoding a protein with a neoxanthin cleavage activity producing transgenic plants with improved or decreased stress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

           CC This invention relates to defence-related signalling genes isolated from CC the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage CC enzyme (NCE), an amino acid permease (AAP) and a glutamic acid rich CC protein (GRP). The signalling gene is useful for increasing the CC resistance of a plant to a pathogen such as fungus, virus, bacterium, CC nematode or insect (e.g. European corn borer), preferably (CC construct containing the gene into the genome of the plant. The gene is CC useful for regulating gene expression in a plant, in response to a CC stimulus such as infection with a pathogen, damage from a pathogen, CC hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid, coxalic acid or expression of a gene encoding oxalic acid oxidase. The genes are also useful for stem-preferred regulation of gene expression in a plant. The genes are useful in agriculture, particularly in the breeding of crop plants with improved agronomic traits, for modifying abscisic acid (ABA) metabolism and for modifying amino acid transport and content in plants. The present sequence represents a neoxanthin cleavage of the content in plants. The present sequence represents an examination of content and content in plants. The present sequence represents an examination of content and content in plants. The present sequence represents a neoxanthin cleavage content in plants. The present sequence represents a neoxanthin cleavage content in plants. The present sequence represents a neoxanthin cleavage content in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated defence-related signalling gene isolated from sunflower encoding neoxanthin cleavage enzyme, amino acid permease or glutamic acid-rich protein useful for increasing resistance of plant to a
sunflower NCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure;

CC corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key crole in endogenous abscisic acid (ABA) biosynthesis under drought stress. CC Neoxanthin cleavage enzyme is used for improving stress tolerance in a cc plant when expressed in a plant cell. The invention also relates to introducing the DNA into the plant, and a transgenic plant into which a cheoxanthin cleavage enzyme is introduced. The improvement of stress concernation of the DNA into the plant, and a transgenic plant into which a cc neoxanthin cleavage enzyme is introduced. The improvement of stress cc cleavage enzyme genes are useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid clarance in mproved by growing transformant weed for several years and cc then removing the weed by specifically lowering stress tolerance in the ceed by inducing an inducible promoter. The present sequence is Cc weed by inducing an inducible promoter. The present sequence is Cc Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED5 protein. CC The AtNCED5 cDNA is obtained from an Arabidopsis plant-derived cDNA cc gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Corresponding cDNA molecules. Neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present sequence is Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED2 protein.

The AtNCED2 cDNA is obtained from an Arabidopsis plant-derived cDNA clibrary using a cDNA of the CRRD55 (CowPea Responsive to Dehydration) covered is considered from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                  This invention relates to defence-related signalling genes isolated from CC the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage CC enzyme (NCE), an amino acid permease (AAP) and a glutamic acid rich CC protein (GRP). The signalling gene is useful for increasing the CC resistance of a plant to a pathogen such as fungus, virus, bacterium, CC nematode or insect (e.g. European corn borer), preferably CC Sclerotinia spp., Phoma spp., or Phomopsis spp. by stably incorporating a CC construct containing the gene into the genome of the plant. The gene is CC useful for regulating gene expression in a plant, in response to a cc stimulus such as infection with a pathogen, damage from a pathogen, CC hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid, coxalic acid or expression of a gene encoding oxalic acid oxidase. The cc a plant. The genes are useful in agriculture, particularly in the cc breeding of crop plants with improved agronomic traits, for modifying content in plants. The present sequence represents a neoxanthin cleavage enzyme-like protein from Arabidopsis thaliana, used in the characterisation of sunflower NCE.

CC corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key CC corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key CC role in endogenous abscisic acid (ABA) biosynthesis under drought stress. CC Neoxanthin cleavage enzyme is used for improving stress tolerance in a CC plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by CC introducing the DNA into the plant, and a transgenic plant into which a CC neoxanthin cleavage enzyme is introduced. The improvement of stress CC tolerance in plants is useful, for example in plant breeding. Neoxanthin CC cleavage enzyme genes are useful for producing transgenic plants. An arid CC company the weed by growing transformant weed for several years and CC then removing the weed by growing transformant weed for several years and CC weed by inducing an inducible promoter. The present sequence is CC Arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED4 protein.
CC The AtNCED4 cDNA is obtained from a Arabidopsis plant-derived cDNA CC ibbrary using a cDNA of the CPRO55 (CowPea Responsive to Dehydration) CC gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches 207;
